2 **Maranhão State, Brazil**

3
4 **Pesquisa de parasitos gastrintestinais do Centro de Triagem de animais selvagens de São**
5 **Luís do Maranhão, Brasil**

6
7 **ABSTRACT.** The objective was to identify the gastrointestinal parasites of wild animals received
8 by the Center for Screening of Wild Animals of São Luis, Maranhão State, Brazil. The fecal
9 samples were collected from 297 animals, of which 150 (50.5%) were birds, 132 (44.5%)
10 mammals and 15 (5%) reptiles. A total of 262 samples (227 individual and 35 pools) were
11 analyzed by the method of sedimentation and flotation, 102 animals were parasitized by
12 helminthes and/or protozoa, 39 of which belonged to the order Primate, 18 to the Carnivorous
13 order and 12 to the Psittaciformes order. The mammals had the greatest diversity of eggs of
14 gastrointestinal parasites: *Strongyloides* sp., *Ancylostoma* sp., *Spirometra* sp., *Ascaris* sp.,
15 *Trichuris vulpis*, *Capillaria* sp., Strongyloidea, Ancylostomidae , taenid and oocysts of coccidian.
16 In the samples of birds were diagnosed eggs of the genera *Dispharynx*, *Ascaridia*, *Echinostoma*
17 and oocyst of coccidian. In the reptiles, the number of gastrointestinal parasites was low, being
18 identified oocyst of coccidian in three jiboia (*Boa constrictor*) and *Capillaria* sp. in an iguana
19 (*Iguana iguana*). It was concluded that wild animals act as hosts for various species of parasites
20 and to establish the dynamics and parasitic fauna of these animals at the screening center is an
21 excellent alternative for studies *ex situ*.

22 **Key words:** Coproparasitology, Endoparasites, Helminths, Mammals, Reptiles

23

24

1 **RESUMO.** Objetivou-se identificar os parasitos gastrintestinais de animais silvestres
2 recepcionados pelo Centro de Triagem de Animais Silvestres de São Luís, Maranhão. As
3 amostras fecais foram coletadas entre agosto de 2006 a julho de 2008, pra um total de 297
4 animais, dos quais 150 (50,5%) foram aves, 132 (44,5%) mamíferos e 15 (5%) répteis. Do
5 total de 262 amostras (227 individuais e 35 *pools*) analisadas pelo método de sedimentação
6 simples e flutuação, 102 animais estavam parasitados por helmintos e/ou protozoários, sendo
7 que, 39 pertenciam à ordem Primata, 18 à Carnívora e 12 à Psittaciforme. Os mamíferos
8 apresentaram a maior diversidade de ovos de parasitos gastrintestinais, *Strongyloides* sp.,
9 *Ancylostoma* sp., *Spirometra* sp., *Ascaris* sp., *Trichuris vulpis*, *Capillaria* sp., Strongyloidea,
10 Ancilostomídeo e tenídeos, além de oocistos de coccídios. Nas amostras de aves
11 identificaram-se ovos dos gêneros *Dispharynx*, *Ascaridia*, *Echinostoma*, e também de
12 oocistos de coccídeos. Nos répteis, o número de parasitos gastrintestinais foi baixo, sendo
13 identificados oocisto de coccídeo em três jiboias (*Boa constrictor*) e *Capillaria* sp. em uma
14 iguana (*Iguana iguana*). Concluiu-se que animais silvestres atuam como hospedeiros para
15 diversas espécies de parasitos, e estabelecer a riqueza e a dinâmica da fauna parasitária desses
16 animais nos centros de triagem é uma excelente alternativa para a realização de estudos *ex*
17 *situ*.

21

INTRODUCTION

22 Brazil takes part of the sixth countries with the richest biological biodiversity
23 (Lewinsohn; Prado, 2002). Due to its importance, surveys on wild fauna in Brazil have been
24 conducted not only to minimize the macroscopic ecological imbalance caused by the
25 historical withdrawal of these animals from its natural habitat but also because the

1 microscopic imbalance that can be caused by internal parasitic fauna. The parasitic fauna have
2 an wild cycle and could have an urban cycle too that same times can have impact on public
3 health (Mackenstedt et al, 2015) such as leishmaniosis, Chagas' disease and hydatidosis
4 (Alexandre, 2000). However, studies on parasitic fauna in wild animals should not be
5 restricted to its role as reservoirs of zoonotic diseases but also as a means of conservation and
6 maintenance of biodiversity (Thompson et al, 2010).

7 Studies have demonstrated that infection by parasites can have severe effects on the
8 survival and reproduction of the host species, therefore elaborate efficient protocols to
9 maintain health and genetic diversity must be a priority (Scott, 1988), especially regarding
10 wild species.

11 Important methods to study the parasitic fauna of wild animals are the fecal exams of
12 the hosts by searching for parasite eggs, cysts, oocysts and larvae (Vieira et al, 2006). These
13 methods are quick, cheap and non-invasive. The relevance of the research on parasitic fauna
14 is recognized and required in reintroduction protocols (UICN, 1998; Felasa, 1999) and also in
15 the clinic routine of wild animals.

16 Though authors believe the captivity condition is a disadvantage for a great varied of
17 parasites since the source of infection are more limited than in free life, in a general way, wild
18 animals housed in captivity are more susceptible to infectious and parasitic diseases (Freitas
19 et al, 2001; 2002), specially due to the inadequate hygiene of the accommodations (Maretto-
20 Gonçalves et al, 2009).

21 Taking into account the spread of the cities upon the wild environment and the
22 participation of man in the parasite life cycle of wild animals (Lim et al, 2008; Li et al, 2015)
23 it is necessary to perform studies on internal fauna of these animals to try to minimize the
24 impact on public and animal health. Moreover, over recent decades, diseases have shown to
25 be important causes of extinctions among wild species. Greater emphasis has been given to

1 diseases transmitted by domestic animals, which has been increasing in numbers in natural
2 areas, along with human populations (Santos et al, 2012).

3 There are few researchers on parasites of wild animals in the State of Maranhão, Brazil
4 and the available information is restrict to external parasites (Guerra et al, 2000; Figueiredo et
5 al, 2010). So the aim of this study was to report on the diversity of parasitic helminthes and
6 protozoan in feces of wild animals received at Center for Screening of Wild Animals of São
7 Luis, Maranhão (CETAS/MA).

8

9

MATERIAL AND METHODS

10 Study area

11 The study was performed in the Center for Screening of Wild Animals of São Luis,
12 Maranhão (CETAS/MA) (2°56'80"S, 44°21'01"O). CETAS belongs to IBAMA, the Brazilian
13 Institute of Environment and Renewable Natural Resources, and has as primary activities to
14 receive, take care, rehabilitate and give a destination of wild animals that were captured,
15 rescued or spontaneously dropped off by the population. Therefore in great majority of the
16 cases the origin of these animals is unknown

17 São Luis city is located at São Luis Island, northeastern of Brazil (Figure 1). The
18 climate is tropical humid and temperatures vary between 26° to 28°C. There are two seasons
19 well defined, the dry season from July to December and the rainy season from January to
20 June. Rainfall index can reach above 2.000 mm³.

21

22 Samples collection and fecal exams

23 Fecal samples were collected during the entrance of the animals at CETAS, from
24 August/2006 to July/2008 covering the dry and rainy seasons. The samples were collected
25 early in the morning in canvas placed under the cages or enclosure of animals'. They were put

1 on recipient per sampled animal or pools when the cage or enclosure had more than one
2 animal. The following methods for finding eggs, cysts, oocysts and larvae of parasites in the
3 samples: flotation in saturated chloride solution (Willis, 1927) and sedimentation (Hoffmann
4 et al., 1934). To visualize parasitic forms a light microscopic was used and the identification
5 was done according to Soulsby (1968), Skryanbin (1969) and Yamaguti (1961).

6 A total of 297 animals were sampled as follows: 15 (5%) reptiles (Table 1), 132
7 (44.5%) mammals and 150 (50,5%) birds (Table 2).

8

9

RESULTS

10 A total of 262 fecal samples were analyzed being 227 individual samples and 35 pools.
11 From the 297 animals, 102 (34.34%) were infected by helminthes and/or protozoan, from
12 these, 63 (61.77%) were mammals, 35 (34.31%) were birds and 4 (3.92%) were reptiles.
13 Same eggs identification only could be done until the taxon of superfamily.

14 Eggs of the following genera of gastrointestinal helminths were identified in birds:
15 *Ascaridia*, *Dispharynx*, *Echinostoma*. Coccidian oocysts were also detected. In the sample
16 pools of *Dendrocygna viduata*, *Amazona amazonica*, *Amazona aestiva* and *Ara maracana* we
17 detected oocysts of coccidian and eggs of *Ascaridia* sp. (Table 3). Mammals were infected by
18 *Strongyloides* sp., *Ancylostoma* sp., *Spirometra* sp., *Ascaris* sp., *Trichuris vulpis*, *Capillaria*
19 sp. (Table 3). Eggs of taenid, Strongyloidea and Ancylostomidae and and oocyst of coccidian
20 were also observed. In reptiles, the prevalence of gastrointestinal parasites was low.
21 Coccidian oocystis in three *B. constrictor* and eggs of *Capillaria* sp.in a *I. iguana* were
22 detected. The results are summarized in Table 3.

23

24

DISCUSSION

25

1 The biodiversity can be composed by different co-evolutionary process in a variety of
2 taxonomic levels (Ehrlich; Raven, 1964; Margulis, 1971; Hamilton et al, 1990; THOMPSON,
3 2009), including parasites. They suffer selective pressure along with their hosts (co-evolution)
4 so when they came to extinction their parasites are extinct as well (Thompson, 2009).

5 The study of the parasitic fauna of domestic and wild animals have much more
6 emphasis in the species that causes economic loss and zoonosis and parasites that have effect
7 on wild fauna are not a priority (Thompson et al., 2010). However, importance should be
8 given to parasitic fauna of wild animals housed in captivity such as the ones from zoo and
9 center of conservation.

10 The release of animals housed in captivity for a long time decrease their immunological
11 capacity to react to great majority of natural pathogens from animals of the same species in a
12 natural environment (Wyatt et al, 2008). Additionally, the impact of human proximity and
13 anthropic action upon the wild environment and consequently to their pathogens is not well
14 established (Thompson et al, 2010).

15 In the present study the gender *Ancylostoma* and *Strongyloides* were the most frequent
16 in fecal samples of mammals. Eggs of *Ancylostoma* were identified in samples from
17 primates, carnivore, rodents and xenarthrans. This helminth has direct life cycle, the infective
18 third larva stage is very active. In domestic canids and felids it is the commonest gender
19 observed (Bowman, 2014) and the most pathogenic species cause anemia and weight loose
20 (Fortes, 1993), it is also common in wild animals (Santos et al., 2015; Kouassi et al., 2015).
21 *Ancylostoma*, one of the most important geohelminth, causes environmental contamination
22 and zoonosis such as cutaneous larva migrans and eosinophilic enteritis in humans. The
23 pathogenicity of the adult worm depends on the parasite load and host age (Bowman, 2014).

24 The genus *Strongyloides* was identified in samples of mammals (primates, carnivores
25 and artiodactyls), the same reported in *Alopex lagopus* by Aguirre et al. (2000) and in

1 carnivores and artiodactyls by Freitas et al. (2001). The greatest number of positive samples
2 for *Strongyloides* was in primates. It could be explained by the fact that the third infective
3 stage of this genus has the capacity of active penetration so animals can be re-infected or
4 infected themselves by entering in contact with contaminated soil (Fortes, 1993). Infection by
5 *Strongyloides* sp. taenid (*Hymenolepis* sp.) in samples from primates have been reported
6 (Gonzalo et al, 1990; Arrojo, 2002), as observed in the present study since we also identified
7 taenid eggs in four samples of neotropical primates. The genus *Strongyloides* infect numerous
8 vertebrate, such as snakes, felids, canids and ruminants (Dorris et al., 2002). In Brazil, species
9 of this genus have been reported infecting a wide diversity of hosts (Vicent et al., 1997) as the
10 first report of the occurrence of *Strongyloides* in *Leopardus trigrinus* in the Botucatu, State
11 of São Paulo by Santos et al. (2009)

12 Eggs of *Spirometra* sp. were detected in samples from *L. tigrinus*, it is a common
13 finding in carnivores, birds and amphibians. These animals generally feed on crustaceans, the
14 intermediate host. This parasite has dogs, cats and raccoons as its definitive hosts (Bowman,
15 2014) and can determine a zoonosis called sparganosis (Mentz et al., 2011). The infection by
16 *Spirometra* was also reported in *Puma concolor* and *Panthera onca* in Perú (TANTALEÁN;
17 Michaud, 2005), in *Leopardus colocolo* in Brazil (Gresseler et al., 2016) and other felids, as
18 observed by Khatun et al. (2014), in lions in captive condition in Bangladesh and snakes
19 (Almeida et al., 2016).

20 *Trichuris vulpis* was identified in samples from *L. pardalis* and *P. yagouaroundi* in the
21 present study. This parasite was reported in wild felids in captive in the State of Santa
22 Catarina, Brazil (Muller et al, 2005). Species of the family Trichuridae were reported in
23 *Leopardus colocolo* by Gresseler et al. (2016) in the State of São Paulo. *Trichuris vulpis* has a

1 short period of maturation in the environment (9 to 10 days) becoming infective in short time
2 enabling re-infection (Fortes, 1993).

3 Birds were infected by *Dispharynx*, *Ascaridia*, *Echinostoma*, besides coccidian as
4 previously reported by Freitas et al. (2002) in the State of Pernambuco, Brazil. *Ascaridia* was
5 the most frequent finding along with coccidian. *Ascaridia* is the most common
6 gastrointestinal helminth in captive birds. It has been reported in exotic birds in the State of
7 Sergipe, Brazil (Lima et al, 2016). This parasite causes deficient absorption, weight loss,
8 anorexia and diarrhea. It has also been described causing intussusception, occlusion and
9 death (Ritchie et al, 1994). It is common in Psittaciformes birds being identified in all orders
10 of birds sampled in the present study. In CETAS of João Pessoa, State of Paraíba, Brazil,
11 *Ascaridia* was recovered by necropsy of Psittaciformes birds as *causa mortis* intestinal due to
12 intestinal obstruction (Melo et al, 2013). According to Snak et al. (2012) taenid eggs were
13 prevalent in captive birds in Paraná State, Brazil, however this eggs were identified in the
14 present study.

15 Coccidian are common intestinal parasites in birds. Here we detected non sporulated
16 oocysts all orders of birds sampled; however they were more prevalent in Anseriformes. In
17 Brazil toucans in captivity are frequently found infected (Benez, 2004). Generally it is
18 necessary to make intense work of eradication in places where coccidian are present since
19 they are resistant to environmental condition, besides they have direct life cycle that enables
20 the persistence of infected animals (Benez, 2004). They are also identified in co-infection
21 with nematodes (Lima et al, 2016), as demonstrated in the present study in *pools* of
22 *Dendrocygna viduata*, *Amazona amazônica*, *Amazona aestiva* e *Ara maracana* (coccidian
23 oocysts and *Ascaridia*).

1 According to Junker et al (2015) coccidiosis is a disease of intensification due to the
2 build-up of the sporulated oocysts in accumulated feces, facilitating ingestion of large
3 infective doses. A further fact is immunosuppression of host, due to stress. This is particularly
4 relevant in free-ranging wild animals brought in captivity, even temporarily.

5 *Dispharynx* is a common nematode on wild birds and birds reared in extensive system
6 (turkey, free-range chicken and guinea fowls). Their habitat in the host is the proventriculus
7 and gizzard (Bartmann; Amato, 2009). Eggs of this parasite were detected in Anseriformes.
8 The pathology caused by this parasite is more severe in young animals and influences their
9 growth (Ritchie et al, 1994; Bartmann; Amato, 2009).

10 In reptiles, the number of gastrointestinal infection was low and oocysts of coccidian
11 were identified in three *B. constrictor* and *Capillaria* sp. in an *I. iguana*. Infections by
12 coccidian are very common in free reptiles and the majority of the cases are of low or none
13 pathogenicity. The infected animals present the intestinal epithelium health or with few
14 lesions, they recovery is fast enough so they are asymptomatic (Raś-Noryńska; Sokół, 2015).
15 Protozoan of the *Eimeria* gender are found in the biliary ducts and gall-bladder of reptiles
16 while *Isospora* is found mainly in the intestine (Raś-Noryńska; Sokół, 2015). According to
17 Rataj et al (2011) *Capillaria* is a common finding in reptiles, however it was not identified
18 here.

19 It should be emphasizes that reptiles became increasingly common domestic pets. In
20 wild, they rarely come into contact with their own waste or uneaten food, which is a common
21 occurrence in captive (Dovc et al, 2004) favoring contact with contaminated materials.

22 The samples that were analyzed by the sedimentation method of Hoffmann et al (1934)
23 presented a more satisfactory results when compared to the results obtained by the use of the
24 flotation method of Willis (1927) since it detected a greater number of positive samples as
25 observed by Cerqueira et al (2007) in comparing the sensibility both methods in diagnosing

1 ancilostomid eggs. Similarly, Freitas et al (2001; 2002) verified that the sedimentation method
2 was more efficient to detect eggs, oocysts and cysts in the feces of wild mammals and birds
3 under captive conditions.

4 It can be concluded that wild animals act as hosts of different species of parasites and
5 the knowledge of the richness parasitic fauna in the Centers for Screening of Wild Animals is
6 an excellent alternative to perform *ex situ* studies as well important for controlling and preventing
7 parasitic diseases.

Figure 1 - Satellite image of Maranhão State, São Luis Island and Center for Screening of Wild Animals of São Luis, Maranhão (CETAS/MA). Source: MapInfo Professional 7.5 SCP; Google earth.

1 Table 1 - List of reptiles sampled at the Center for Screening of Wild Animals of São Luis,
 2 Maranhão State (CETAS/MA), Brazil, from August/2006 to July/2008.

Order	Family	Common name in English	Number sampled/Specie
Squamata	Iguanidae	Green iguana	01 <i>Iguana iguana</i>
	Boidae	Boa constrictor	12 <i>Boa constrictor</i> 01 <i>Boa constrictor amarili</i>
Chelonia	Chelonidae	Yellow-footed Tortoise	01 <i>Geochelone denticulata</i>

3

4

5 Table 2 - List of mammals and birds sampled at the Center for Screening of Wild Animals of
 6 São Luis, Maranhão State (CETAS/MA), Brazil, from August/2006 to July/2008.

Order	Family	Common name in English	Number sampled/Species
Mammals			
Primata	Cebidae	Tufted capuchin	69 <i>Sapajus apella</i>
		Squirrel monkey	07 <i>Saimiri sciureus</i>
	Callithrichidae	Common marmoset	04 <i>Callithrix jacchus</i>
		Tamarin	05 <i>Saguinus midas niger</i>
	Atelidae	Black Howler	01 <i>Alouatta caraya</i>
Carnivora	Canidae	Crab-eating fox	03 <i>Cerdocyon thous</i>
	Procyonidae	South American Coati	12 <i>Nasua nasua</i>
		Raccoon	01 <i>Procyon cancrivorus</i>
	Felidae	Oncelot	04 <i>Leopardus pardalis</i>
		Jaguarundi	02 <i>Puma yagouaroundi</i>
		Margay	02 <i>Leopardus wiedii</i>
		Northern Tiger Cat	06 <i>Leopardus tigrinus</i>
	Mustelidae	Lesser grison	03 <i>Galictis cuja</i>
Didelphimorphia	Didelphidae	Opossum	02 <i>Didelphis marsupialis</i>
Artiodactyla	Cervidae	Brown brocket	01 <i>Mazana gouazoubira</i>
Rodentia	Agoutidae	Spotted paca	03 <i>Agouti paca</i>
Xenarthra	Myrmecophagidae	Southern tamandua	02 <i>Tamandua tetradactyla</i>
	Bradypodidae	Brown-throated Sloth	05 <i>Bradypus variegatus</i>
Birds			
Anseriforme	Anatidae	White-faced duck	28 <i>Dendrocygna viduata</i>
		Black-bellied Whistling-duck	18 <i>Dendrocygna autumnalis</i>
Psittaciforme	Psittacidae	White-winged Parakeet	04 <i>Brotogeris versicolurus</i>
		Golden Parakeet	03 <i>Guaruba guarouba</i>
		Peach-fronted Parakeet	02 <i>Eupsittula aurea</i>
		Orange-winged Amazon	23 <i>Amazona amazonica</i>

		turquoise-fronted amazon	22 <i>Amazona aestiva</i>
		White-eyed Parakeet	02 <i>Aratinga leucophthalmus</i>
		Scarlet Macaw	
		Blue-winged Macaw	02 <i>Ara macao</i>
		Scaly-headed Parrot	03 <i>Ara maracana</i>
		Scaly-headed Parrot	01 <i>Pionus menstruus</i>
			01 <i>Pionus maximiliani</i>
Strigiforme	Tytonidae	Common Barn-owl	07 <i>Tyto Alba</i>
		Tropical Screech-owl	02 <i>Megascops choliba</i>
	Strigidae	Striped Owl	01 <i>Asio clamator</i>
		Burrowing Owl	02 <i>Speotyto cunicularia</i>
Passeriforme	Fringilidae	Purple-throated Euphonia	03 <i>Euphonia chlorotica</i>
		Lined Seedeater	05 <i>Sporophila lineola</i>
		Campo Troupial	05 <i>Icterus jamaicaii</i>
		White-lined Tanager	01 <i>Thachyphonus rufus</i>
		Chopi Blackbird	01 <i>Gnorimopsar chopi</i>
		Yellow-rumped Cacique	01 <i>Cacicus cela</i>
	Sturnidae	Tropical Mockingbird	05 <i>Mimus gilvus</i>
Piciforme	Ramphastidae	Channel-billed Toucan	06 <i>Ramphastos vitelinus</i>
		Red-billed Toucan	01 <i>Ramphastos tucanus</i>
		Spot-billed Toucanet	01 <i>Selenidera maculirostris</i>

3 Table 3 - Parasites (eggs and oocysts) in wild animals from the Center Center for Screening of
4 Wild Animals of São Luis, Maranhão State (CETAS/MA), Brazil , from
5 August/2006 to July/2008.

Animals	Number of positive samples	Species	Parasites (eggs/oocysts)*
Birds			
Pool	04	<i>Dendrocygna viduata</i>	Oocisto de coccídeo, <i>Ascaridia</i> sp. <i>Dispharynx</i> sp.
	04	<i>Amazona amazonica</i>	Oocisto de coccídeo e <i>Ascaridia</i> sp.
	03	<i>Amazona aestiva</i>	
	01	<i>Ara maracana</i>	
Individual	05	<i>Tyto Alba</i>	Oocisto de coccídeo
Pool	03	<i>Dendrocygna autumnalis</i>	<i>Echinostoma</i> sp., <i>Ascaridia</i> sp.
Individual	01	<i>Sporophila lineola</i>	Oocisto de coccídeo
Individual	01	<i>Ramphastos toco</i>	Oocisto de coccídeo
Mammals			
Individual	06	<i>Leopardus tigrinus</i>	<i>Spirometra</i> sp.

Individual	04	<i>Leopardus pardalis</i>	<i>Trichuris vulpis</i>
Individual	02	<i>Puma yagouaroundi</i>	<i>Trichuris vulpis</i>
Pool	04	<i>Nasua nasua</i>	<i>Strongyloides</i> sp., <i>Ancilostomideo</i>
Pool	02	<i>Cerdocyon thous</i>	<i>Ancylostoma</i> sp., oocisto de coccídeo
Individual	05	<i>Saimiri sciureus</i>	<i>Ancylostoma</i> sp., <i>Ascaris</i> sp., taenídeo
Individual	15	<i>Sapajus apella</i>	<i>Ancylostoma</i> sp., <i>Ascaris</i> sp., <i>Strongyloidea</i>
Pool	05	<i>Sapajus apella</i>	<i>Ancylostoma</i> sp., <i>Ascaris</i> sp., oocisto de coccídeo, <i>Capillaria</i> sp., taenídeo, <i>Strongyloidea</i>
Individual	03	<i>Agouti paca</i>	<i>Strongyloides</i> sp., <i>Ancylostoma</i> sp.
Individual	02	<i>Tamandua tetradactyla</i>	<i>Ancylostoma</i> sp.
Individual	01	<i>Mazana gouazoubira</i>	<i>Strongyloides</i> sp.
Reptiles			
Individual	01	<i>Iguana iguana</i>	<i>Capillaria</i> sp.
Individual	03	<i>Boa constrictor</i>	Oocisto de coccídeo

1 P – pool; I – individual samples
